

PIVAH PROTOCOL

Roadmap

Live on Base mainnet, independently audited, in active use. Timelines beyond today are indicative and will shift with security priorities and community feedback.

Phase 0 — Foundation **COMPLETED**

- Creator Studio — deploy a collection with one shared image (any supply) or generate unique 1-of-1 NFTs from layered traits, with a live local preview before anything touches the chain.
- Pivah DEX — bonding-curve liquidity pools per collection; starting price derived automatically from a pool's first NFT+WETH deposit.
- Marketplace — peer-to-peer listings with escrow, single or batch listing, per-NFT pricing for collections where rarity should command different prices.
- Staking — the PIVAH token and an NFT-staking vault that accepts any collection, from any origin.

Phase 1 — Protocol Hardening **COMPLETED**

- Extensive real-world validation before mainnet — real collections, real pools, and real trades, with every early participant's activity tracked for the reward consideration that later shaped Phase 2's staking rollout.
- UX friction fixed as found — automatic DEX pricing, marketplace escrow, and bulk NFT pricing tools all shipped in direct response to real usage.
- Hardened the generative trait-collection pipeline: canvas alignment, transparency validation, visual alignment guides.

Phase 2 — Audit & Mainnet Launch **COMPLETED**

- Independent, professional smart contract audit of every core contract by Web3Sentinel.
- All audit findings addressed prior to launch.
- Full mainnet deployment on Base — core protocol, PIVAH token, and NFT staking vault, all independently verified on BaseScan.

Phase 3 — Ecosystem Growth **IN PROGRESS**

- Active creator onboarding — collections from outside Pivah's own Creator Studio are already fully supported today.
- Real trading activity across the Marketplace and DEX, with live NFT staking and reward accrual.
- Exchange listing outreach for PIVAH in progress.
- On-chain vesting contracts for team, advisor and community token allocations — not manual transfers.
- Mobile-first refinements across Creator Studio, DEX and Marketplace.
- Evaluate expansion beyond Base once mainnet usage patterns are understood.
- Formal partnerships with complementary NFT and DeFi protocols.

Phase 4 — Decentralisation **PLANNED**

- DAO governance framework covering treasury allocation and protocol parameters.
- Progressive handover of Treasury/DAO Reserve control to token holders.
- Protocol-owned liquidity strategy to reduce long-term reliance on external LPs.

Every contract now live on Base mainnet went through the same rigour before launch: audited independently, compiled, tested, and verified end to end — no change was treated as done until it was confirmed working against real transactions.
